

Dear NeuroML2023 team,

This is a thank you letter!

Thank you for the course, it gave me understanding of the basic concepts of ML (I hope at least) and its implementation in the neuroscience (which I passionate about).

Especially I want to thank Maria Zubrikhina, who was my TA and helped a lot with explanations of code details and even some usual mistakes people do in machine learning, so I could avoid them. Masha, you should definitely create the lecture about these mistakes, it's a great idea!

Of course I'm grateful to Maxim Sharaev whose lectures was interesting and quite easy to understand and if something was not so, there was always a chance to ask questions.

Other TAs, thank you for the seminars, for me as a biologist, they were tough, but we've survived

 Docker is working))

I hope to see you again!

P.S. I added baseline classifiers that were mentioned on the Q&A session after presentation, my models work a bit better than them, so I think we can analyse top features to find biological logic.
